*ASPARAGUS, SNAP BEANS, CABBAGE FOR KRAUT, SWEET CORN, CUCUMBERS FOR PICKLES
GREEN PEAS, SPINACH, TOMATOES

THE VEGETABLE SITUATION

Summary

An early severe frost in the deep South in mid-November materially reduced the prospects for fall planted tender vegetables. The hardier types escaped serious injury, however, and the supplies that usually come from California and Arizona are expected to be available in normal quantities. Also, the supplies of northern stored crops such as cabbage, onions, carrots, etc. are plentiful.

As a result of the reduction in supplies by frost, market prices of tender vegetables rose sharply in late November. Prices of most other vegetables showed only seasonal changes, and averaged generally below those of a year earlier. The lower prices this season reflect the larger supplies, which have more than offset the influence of increased consumer purchasing power.

Late potato crop prospects improved in October, and the November crop estimate of 309 million bushels is about 19 million larger than the crop a year earlier. Ample market supplies are indicated to be available for the winter and spring months. It appears, however, that the seasonal low point in prices has been passed.

Sweetpotato prospects declined in October. The crop as of November 1 is estimated to total only 63.6 million bushels, or about 9 million bushels less than that of 1939. Prices in late November were substantially higher than a year earlier and are expected to continue to rise seasonally during the remainder of the season.

Dry bean prospects showed little change during the last month, and supplies for the season are indicated to be the largest on record. A record

large carry-over coupled with a larger crop than a year carlier has resulted in these increased market supplies. As a result of this situation, the price prospect for many of the important varieties is discouraging.

- November 29, 1940

POTATOES

Late potato crop prospects continued to improve in October, and as of November 1 production was indicated to total 309 million bushels. A slight increase over a month earlier in the eight Eastern States and a 6-million bushel gain in the 12 Western States more than offset a 1.2-million bushel decrease in the 10 Central States. As compared with the 1939 crop, the current estimate is about 19 million bushels larger for the country as a whole, with the greatest increases occurring in the eight Eastern and 12 Western States. Since the bulk of the crop produced in the Western States is usually marketed in the Central States (both North and South Central) the total supply of late potatoes available for these areas and the Far West is about 201 million bushels this season compared with 192 million bushels in 1939. This is an increase of about 5 percent, as compared with a 11 percent increase in supplies in the Eastern States.

As a result of these increases in late potato supplies this season, market prices have declined to relatively low levels. Prices in November were substantially below those of a year earlier, a situation which illustrates strikingly how a relatively small increase in potato supplies can bring about a substantial decline in potato prices. At New York City prices of some important varieties were more than 50 percent below those of a year earlier, while at Chicago, a market in the Central States where the crop is only about 1 percent larger, prices were 10 to 15 percent below. It is now apparent that prices have passed the low point of the season, and that at least a slight seasonal rise is in prospect for the next few months.

SWEETPOTATOES

Prospects for the sweetpotato crop declined during October, and as of November 1 the crop was estimated to total 63.6 million bushels. This estimate is 2.5 million bushels less than that of a month earlier and about 9 million bushels smaller than the crop produced in 1939. As compared with the 1939 crop, this season's output is smaller in the three important regions comprising the two Atlantic Coast groups and the South Central States. Production this year in the North Central States and California is slightly larger than it was last year. As a result of the shift in supplies this year, market prices in late November averaged somewhat higher than a year earlier. Prices apparently have passed the season's low point and are trending upward. In seasons of relatively small supplies, such as this year, sweetpotato prices usually rise sharply from November to the end of the season.

DRY BEANS

There was little change from earlier reports in the crop prospect reported as of November 1. The commercial production of dry edible beans is

now indicated to total 15.1 million bags this season, compared with 14 million last season. The crop produced in the area which produces largely red kidneys and pea beans is about 800,000 bags short of that of 1939, but production in all the other areas is considerably larger. California has an unusually large crop of beans this season.

Because of a large carry-over and the larger crop this season, the total supply is estimated to be close to 18.5 million bags. This is about 1.3 million bags larger than the 1939 supply and is the largest on record. Although it is too early to get definite information concerning production by varieties, the supplies of the Pinto, Great Northern, and some California varieties probably are unusually large. Market prices in recent months have reflected this situation. Prices of Pintos, Great Northern, the limas, small red, and Blackeye have all declined in recent months. And with supplies at record high levels no appreciable change in price levels are in prospect during the remainder of the season, even though consumer buying power will be materially higher than a year earlier.

Exports during the first month of the new season totaled 33,000 bags, considerably less than the 44,000 bags exported during September 1939. Last season a considerable quantity of dry beans were exported to France and some other areas of Europe that are now closed to United States trade. For this reason total exports probably will not exceed 500,000 bags as compared with 793,000 bags exported in the 1939 season. Shipments to offshore possessions, which totaled about 434,000 bags last season, probably will be increased somewhat this season. Exports and shipments combined, however, probably will be only about 60 percent as great this year as last, which will mean added supplies available for the domestic market.

TRUCK CROPS

An early severe frost cut deep into the Southern States in mid-November and destroyed a considerable acreage of tender fall vegetables such as tomatoes, peppers, eggplant, snap beans, and cucumbers. As a result, supplies for immediate marketing will be reduced materially. Some late crops in the Northern States, the harvest of which was not yet completed, were also damaged to some extent by the freezing weather.

Prior to the freeze prospects were favorable for large supplies of fall vegetables in the earliest areas of the South. Marketings of an unusually large crop of fall snap beans totaling 3 million bushels will be reduced during the next few weeks. The remaining supplies of the last of the late 1940 crops were completely wiped out by the cold weather. The situation immediately changes from one of a surplus in snap beans to one of a scarcity. Likewise, the freeze reduced the prospects of a large fall crop of cucumbers, estimated before the freeze at 180,000 bushels compared with 162,000 last year. About 75 percent of the Texas eggplant crop of 50,000 bushels was destroyed, and the prospect of 180,000 bushels in Florida was reduced materially. A large fall green pepper crop was just coming into heavy production in Texas when the frost occurred. Both the Texas and Florida prospect, totaling 758,000 bushels compared with 720,000 last season, was sharply reduced. Freeze loss of tomatoes was particularly severe in Texas and was considerable in certain areas of Florida. A fall crop indicated at

1,540,000 bushels before the freeze has been reduced considerably. Apparently supplies of all these vegetables for the next 2 months will be substantially smaller than those anticipated last month and greatly reduced from those of a year earlier.

The cold weather was not particularly harmful to growing truck crops in Arizona and California, and such crops as artichokes, broccoli, carrots, cauliflower, celery, and lettuce are expected to be in normal supply during the winter months. Production of artichokes, cauliflower, and lettuce is indicated to be larger than a year earlier while that of carrots and celery is slightly smaller.

The cold did not appreciably change the supply situation for the hardier types of vegetables, such as beets, cabbage, collards, kale, and spinach. The prospect for most of these is for an ample supply. There is also an ample supply of such stored vegetables as late onions, late carrots, and cabbage. The late onion crop totaled 12.1 million bags compared with the 10-year (1929-38) average of 10.3 million bags; the late Danish cabbage crop of 291,100 tons was about the same as the average; and late carrot production totaled 3.2 million bushels compared with the average of 2.8 million.

Looking farther ahead, the prospect is for increased production next spring of asparagus, cabbage, and onions. The total acreage of asparagus expected to be available for harvest for both the fresh market and processing totals 131,000 acres compared with 129,000 acres in 1940, a slight increase in the late States more than offsetting a slight decrease in the early areas. The prospective acreage of early cabbage is indicated to total about 54,850 acres compared with 49,650 acres harvested in 1940. Although young cabbage plants in Florida and Texas suffered some damage from the freeze, it is expected that only a small acreage will be lost. Prospective plantings of early onions total 45,300 acres this season, or about 48 percent more than the 30,600 acres harvested in 1940. Most of this increase is expected to occur in Texas, where a dry season prevented the usual plantings last season.

As a result of the change in the supply situation with respect to snap beans, cucumbers, eggplant, peppers and tomatoes, market prices of these vegetables rose sharply in late November. Price changes for most other vegetables were more or less seasonal in nature. In general, however, truck crop prices continue to average lower than a year earlier, reflecting the larger supplies available. The generally increased supplies this season, with the exception of those suffering most from the freeze damage, have more than offset the influence of greater consumer purchasing power on vegetable prices.

The following statement concerning winter vegetable prospects in Cuba, was prepared by the Office of Foreign Agricultural Relations on the basis of reports received from the American Consul, Harold S. Tewell, at Habana:

HEAVY CUBAN VEGETABLE CROPS IN PROSPECT: EXPORTS TO UNITED STATES LIKELY TO BE REDUCED

Growing conditions in Cuba have been very good thus far in the current season and the early crop of winter vegetables is expected to be as large as

that of last year despite somewhat reduced acreage in certain vegetables. Last season excessive rainfall and winds reduced the early crop appreciably. This year the early tomato crop is expected to be fully as large as that of 1939 and exports of 300,000 lugs (of about 32 pounds) up to mid-January are being anticipated. Late tomato acreage is about the same as last year. Whether exports will reach the total of 1,400,000 lugs shipped between mid-January to April will depend largely upon winter weather in Cuba and demand conditions in the United States. Last season Cuban exports reached a record high of 110 million pounds, chiefly because freeze damage in late January very substantially reduced the Florida crop. This season with more normal supplies from Florida being anticipated shipments are likely to be reduced although increased purchasing power in the United States may tend to offset this somewhat.

The acreage in peppers, cucumbers, and potatoes is estimated at somewhat larger than that of 1939 and the new crops are expected to equal the record supplies last year. Exports, however, are expected to be below the heavy 1939 movement. The acreage in lima beans is somewhat smaller but a larger crop is expected because of improved growing conditions. Eggplant acreage has not been increased but heavier yields are being anticipated.

Dry weather prevailed in certain Cuban winter vegetable areas during the fall planting period, but unusually late rains fell in these regions during September and October. Unlike last year when rain damage was widespread only in isolated areas have rains been sufficient to materially affect the crops. Beneficial rains, warm days and cool nights and the absence of high winds have marked the current season thus far and, as a result, the crops generally are reported to be in excellent condition.

Negligible loss of seed tomato beds occurred in 1940 compared with very material loss reported in the previous season. Preliminary estimates indicate that plantings for the early crop are below those of last year but production is expected to be as heavy as in 1939. Exports to the United States from the early crop in 1939 amounted to about 300,000 lugs of which 49,000 lugs were shipped in November, 132,000 in December and 70,000 lugs early in January. The total early movement in 1940 is expected to be about the same as last year. The first shipments went forward early in November. The quality of early tomatoes is reported as very good, while dry weather in certain areas has tended to reduce sizes somewhat.

At present the late crop, which is harvested after the middle of January, is being set out. Weather conditions in the Province of Santa Clara (now known as Las Villas), where most of the plantings have taken place, are reported as favorable. Exports from the late crop are not expected to exceed 900,000 lugs (compared with 1,422,000 lugs last season) provided Florida supplies are normal. Under these conditions total exports should be around 1,200,000 lugs for the season. If extensive damage occurs in producing areas outside Cuba similar to that which took place last year, it is possible that the season's movement may total 1,700,000 lugs.

A larger acreage of Cuban peppers is reported as a result of the good market existing last season. During November and December last season exports totaled 1,755 crates and shipments this season are expected to be at about

the same level. Mature peppers are now available in Cuba. The eggplant crop is expected to be larger than last year's but exports are expected to be somewhat below the 1939-40 total. Early shipments of eggplant have already taken place. About 550 acres have been planted to cucumbers compared with 450 acres last winter. This crop is produced chiefly on the Isle of Pines. Supplies this season are heavier but exports will be determined by United States market conditions.

Small shipments of <u>lima beans</u> to the United States were made early in the month. Acreage this year is below that of 1939 but the crop is in much better condition. Last winter fumigation of exports was begun and will be continued this year. In addition, cooling facilities have been installed in packing plants to prevent discoloration of the beans because of heating after the vegetable is packed. Accordingly, considerable improvement in the quality and condition of exports is expected. The <u>okra</u> acreage is about the same as in 1939 and exports are expected to be at around the level of the previous season.
